Dr [REDACTED]  
[REDACTED]  
[REDACTED]

Location: North Shore Radiology  
Examined: 17 August 2021  
Reported: 17 August 2021  
Acc No: 88.1167584

cc: Dr M [REDACTED] [REDACTED]

Dear Dr [REDACTED]

Re: Mr Michael [REDACTED] Folio No: 26.00712251  
DOB: [REDACTED]

## CT Chest with Contrast

### Clinical History:

History of prostate cancer 2017 with no known metastases. Also rheumatoid arthritis and osteoporosis. Fall in December 2020 with rib fractures. No rib pain now. ? old fractures ? metastasis.

### Comparison:

Bone scan 13/08/2021, CT abdomen and pelvis 4/9/2018, CT chest abdomen pelvis 31/10/2016.

### Technique:

Postcontrast CT chest.

### Findings:

The lungs are clear with no focal pulmonary nodule, collapse or consolidation identified. No pleural effusion or pneumothorax.

The thoracic aorta outlines normally. No pericardial effusion.

No size significant intrathoracic lymphadenopathy is detected.

Bilateral adrenal nodules (right 30 mm, left 15 mm) are stable since the CT performed 31/10/2016, and most in keeping with adrenal adenomas. 12 mm hypodense lesion in segment VII of the liver is stable in size since the CT of 23/10/2016, and demonstrates discontinuous peripheral enhancement, most in keeping with an incidental hepatic haemangioma. Bilateral gynaecomastia is noted.

There are subacute minimal displaced healing fractures of the right 5th rib anteriorly, right 8th and 9th ribs anterolaterally and posterolaterally, and 10th and 11th ribs posteriorly. These demonstrate callus formation. There is also mild deformity and sclerosis of the left seventh rib anteriorly suspicious for a further fracture. Mild compression fractures of T6, T8, T9, T10 and T11 are unchanged.

**CONCLUSION:**

Multiple right-sided subacute minimally displaced healing fractures as described (the right 8th and 9th ribs are fractured at two sites), and a suspected anterior left seventh rib fracture.
