Transcription Date:

LEFT SHOULDER XRAY

There is bony pitting and sclerosis of the greater tuberosity in the region of supraspinatus tendon insertion. No soft tissue calcification is seen in the region of the rotator cuff.

There is a small amount of bony spurring at the lateral aspect of the olecranon, and along its anterior undersurface. The acromion demonstrates type II morphology.
The AC joint appears normal.

No osteophyte formation nor osteochondral change of the glenohumeral joint is seen.

Thank you for referring this patient
